

## Exam Preparation - Conduction 15

A cylinder of diameter  $d = 0.5$  cm with initial homogeneous temperature  $T(r, t = 0) = 293$  K, is suddenly exposed to a medium of temperature  $T_A = 353$  K. Determine the time  $t_1$  at which  $T(r = 0, t_1) = 341$  K is reached.

Problem type:

One-dimensional, unsteady heat conduction that does penetrate.

$$\frac{1}{Bi} = \frac{\lambda}{\alpha \cdot r_1} = 7$$

$$\frac{T_m - T_a}{T_o - T_a} = 0.2$$

$$\rightarrow Fo = 6.51$$

$$t = 3021.11 \text{ s}$$
